

RCV

This versatile range of diffusers is supplied complete with a low profile body and radial front face plate, which is easily installed in inverted “T” type or plaster board ceilings.

The TROX Diffusers Constant Volume (DCV / RCV) are intended mainly for use in internal zones of a building where uniform radial discharge is the most suitable air distribution pattern.

Although the DCV & RCV are constant volume diffusers, the supply air volume may be manually adjusted to obtain the required design air flow. This is done by removing the decorative cap in the centre of the face of the face plate and by inserting a flat point screw driver to adjust the control disc position up or down, to increase or decrease the air volume, as required.
